

2. PLANNING OF CHP SYSTEMS

Asko Vuorinen

10.3.2016

Aalto University

Saving by Combined Heat and Power (CHP) generation

Separate generation

| | | | |
|--------------------|-------|------|--------|
| - power plant | 40 MW | Fuel | 100 MW |
| - hot water boiler | 50 MW | | 60 MW |

160 MW 100 %

CHP

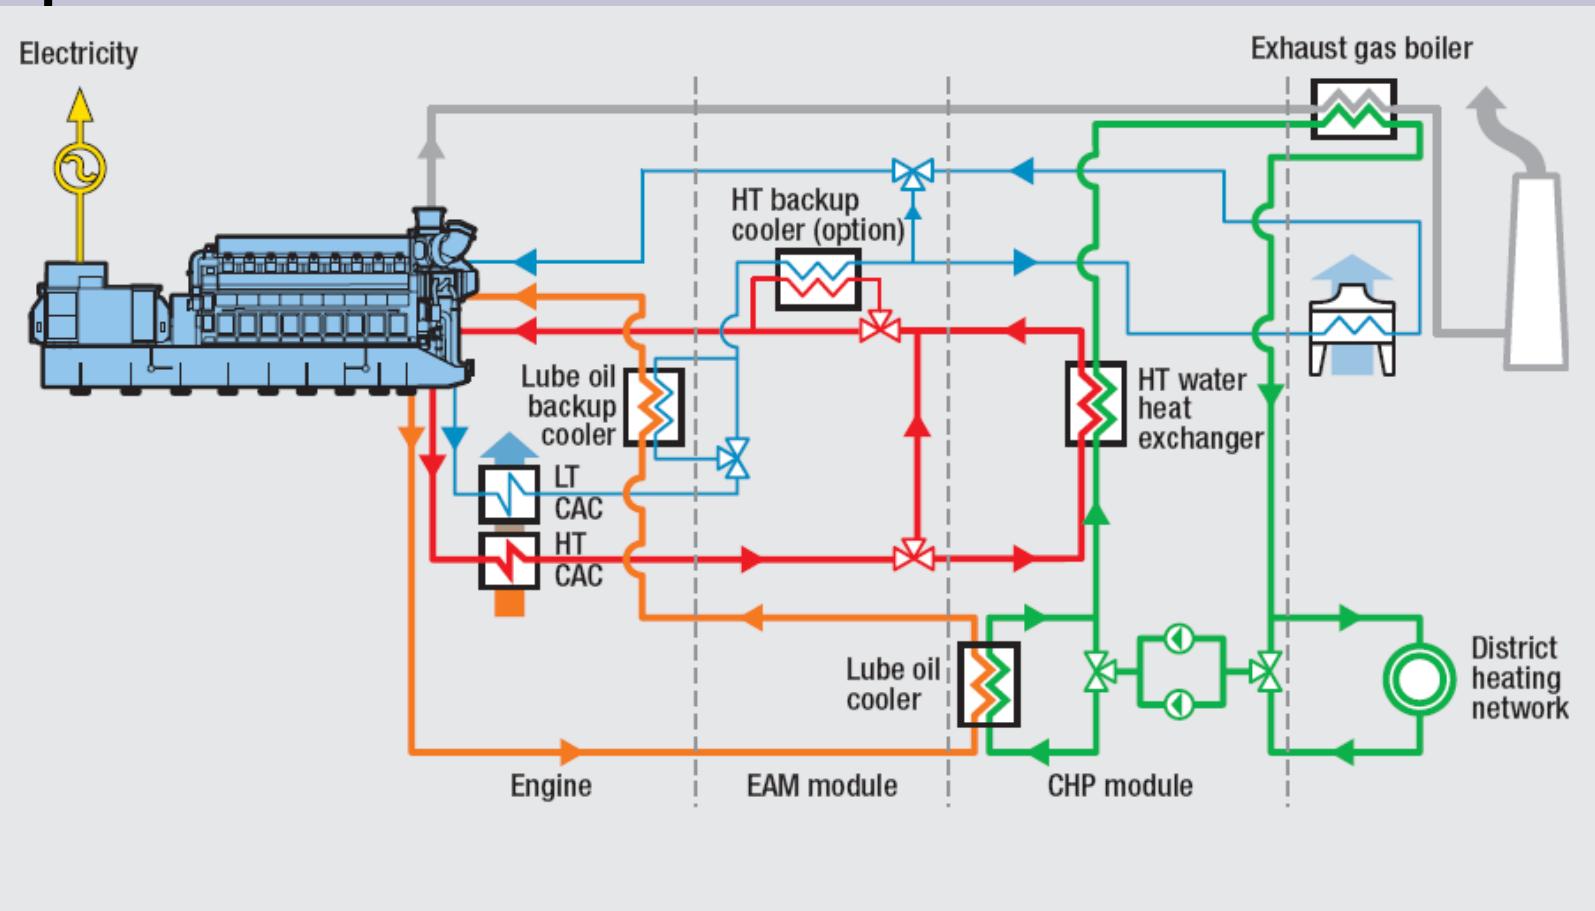

| | | | |
|---------|-------|--------|------|
| - power | 40 MW | | |
| - Heat | 50 MW | 100 MW | 62 % |

Saving 60 MW 38 %

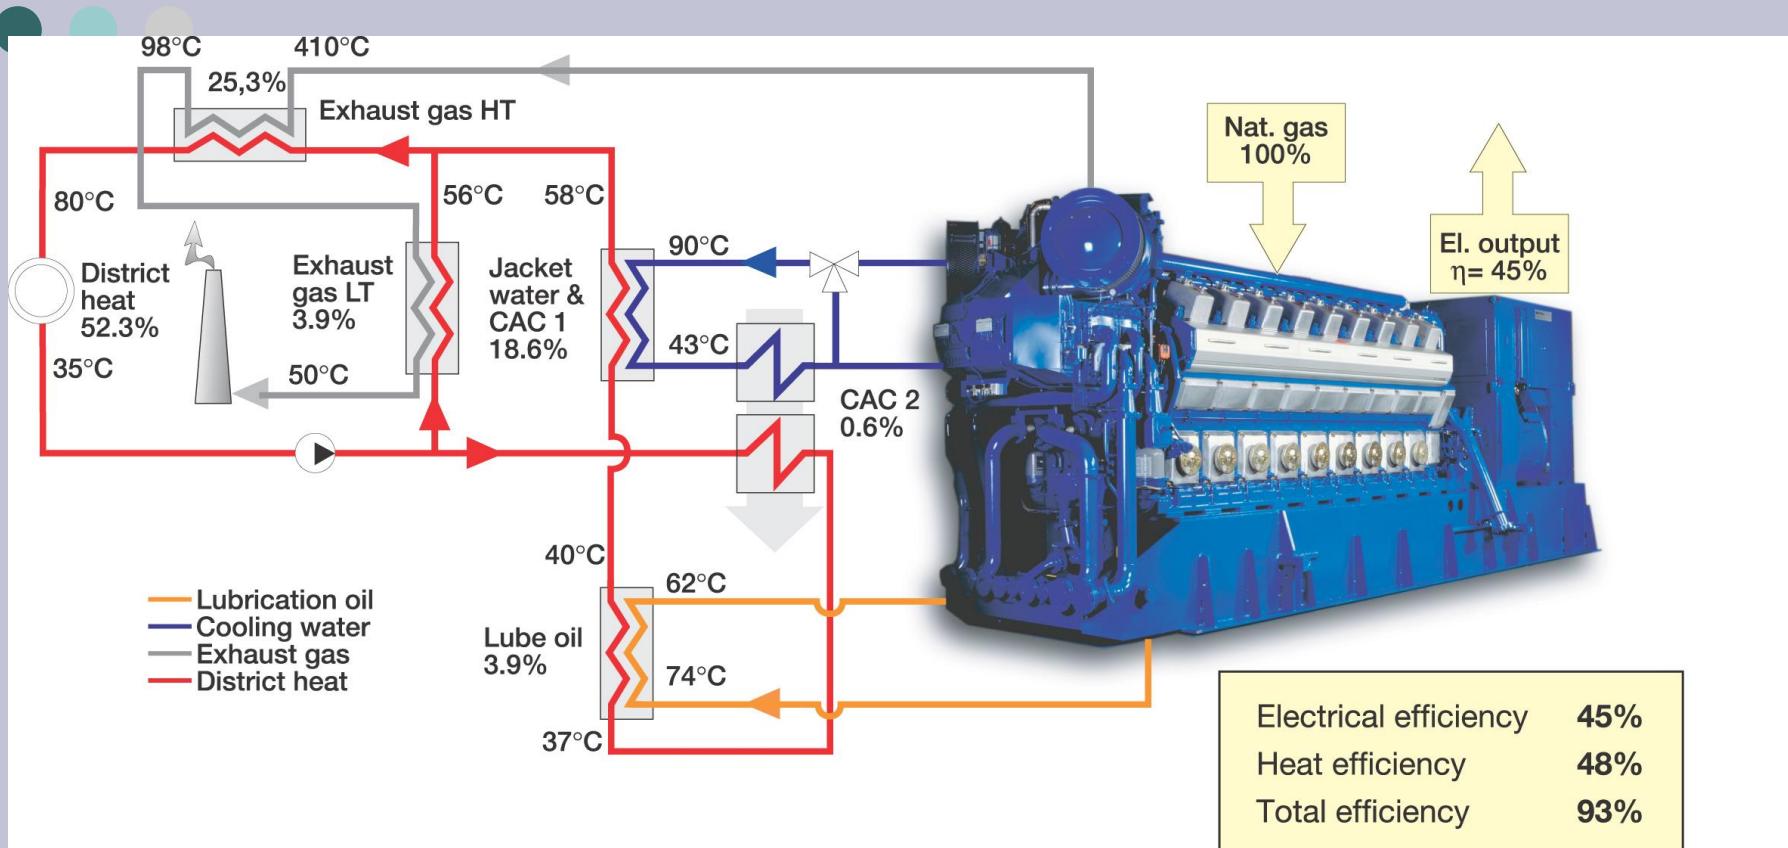

Heat recovery systems

Wärtsilä 34 SG-engine: Electricity 8,7 MW, Heat 8,0 MW, Efficiency 85 %

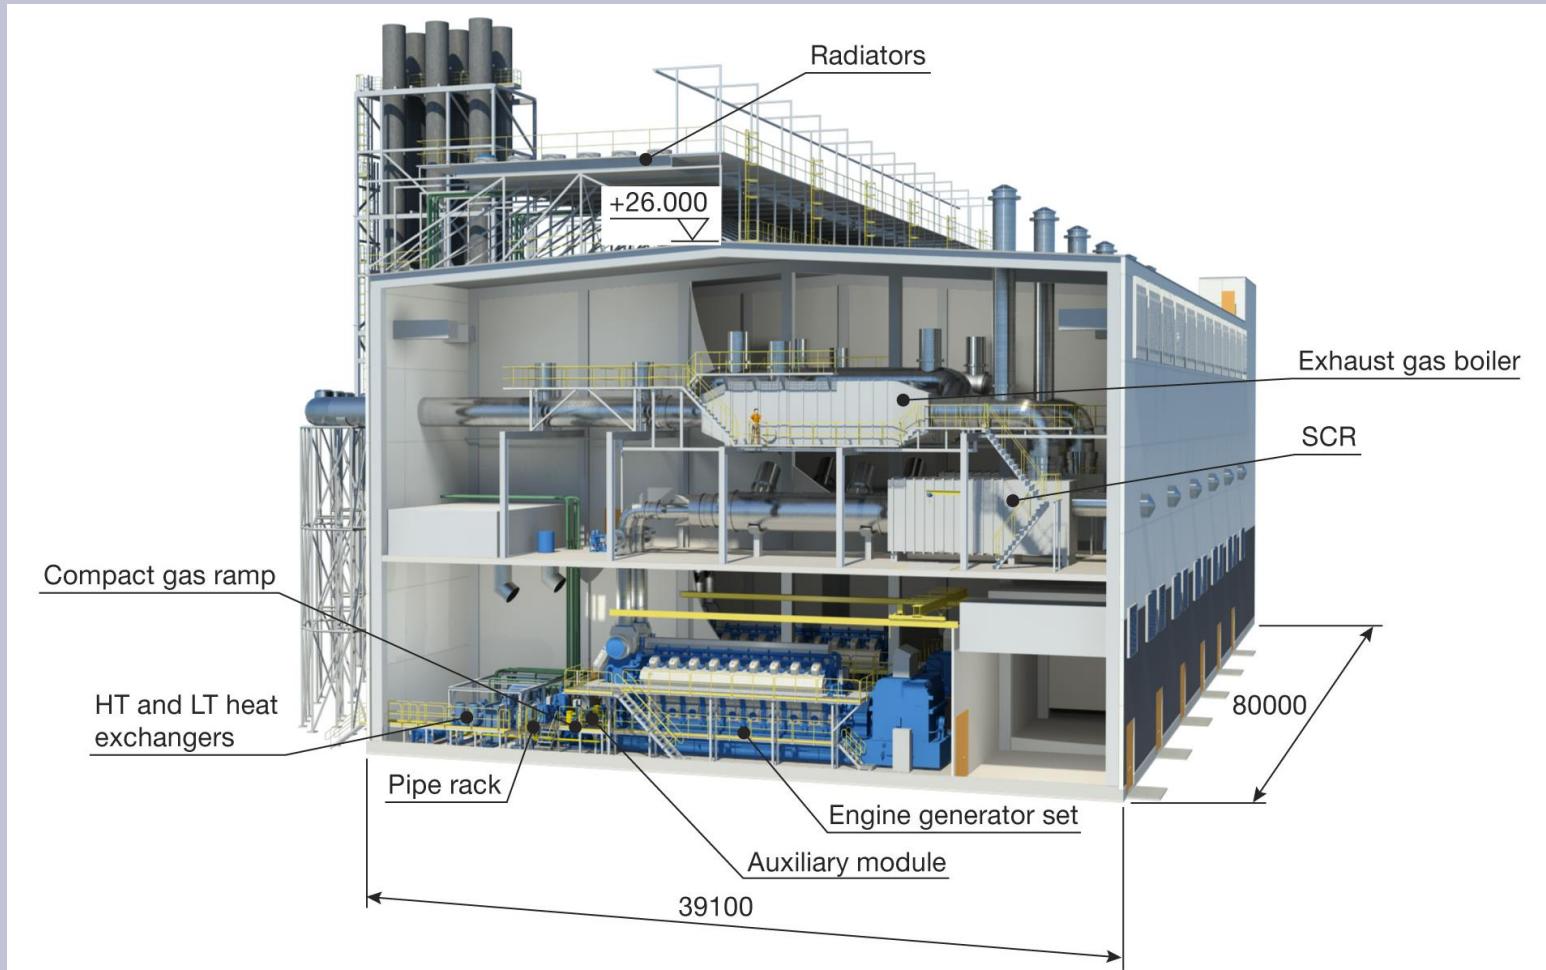

Danish case 93 % efficiency

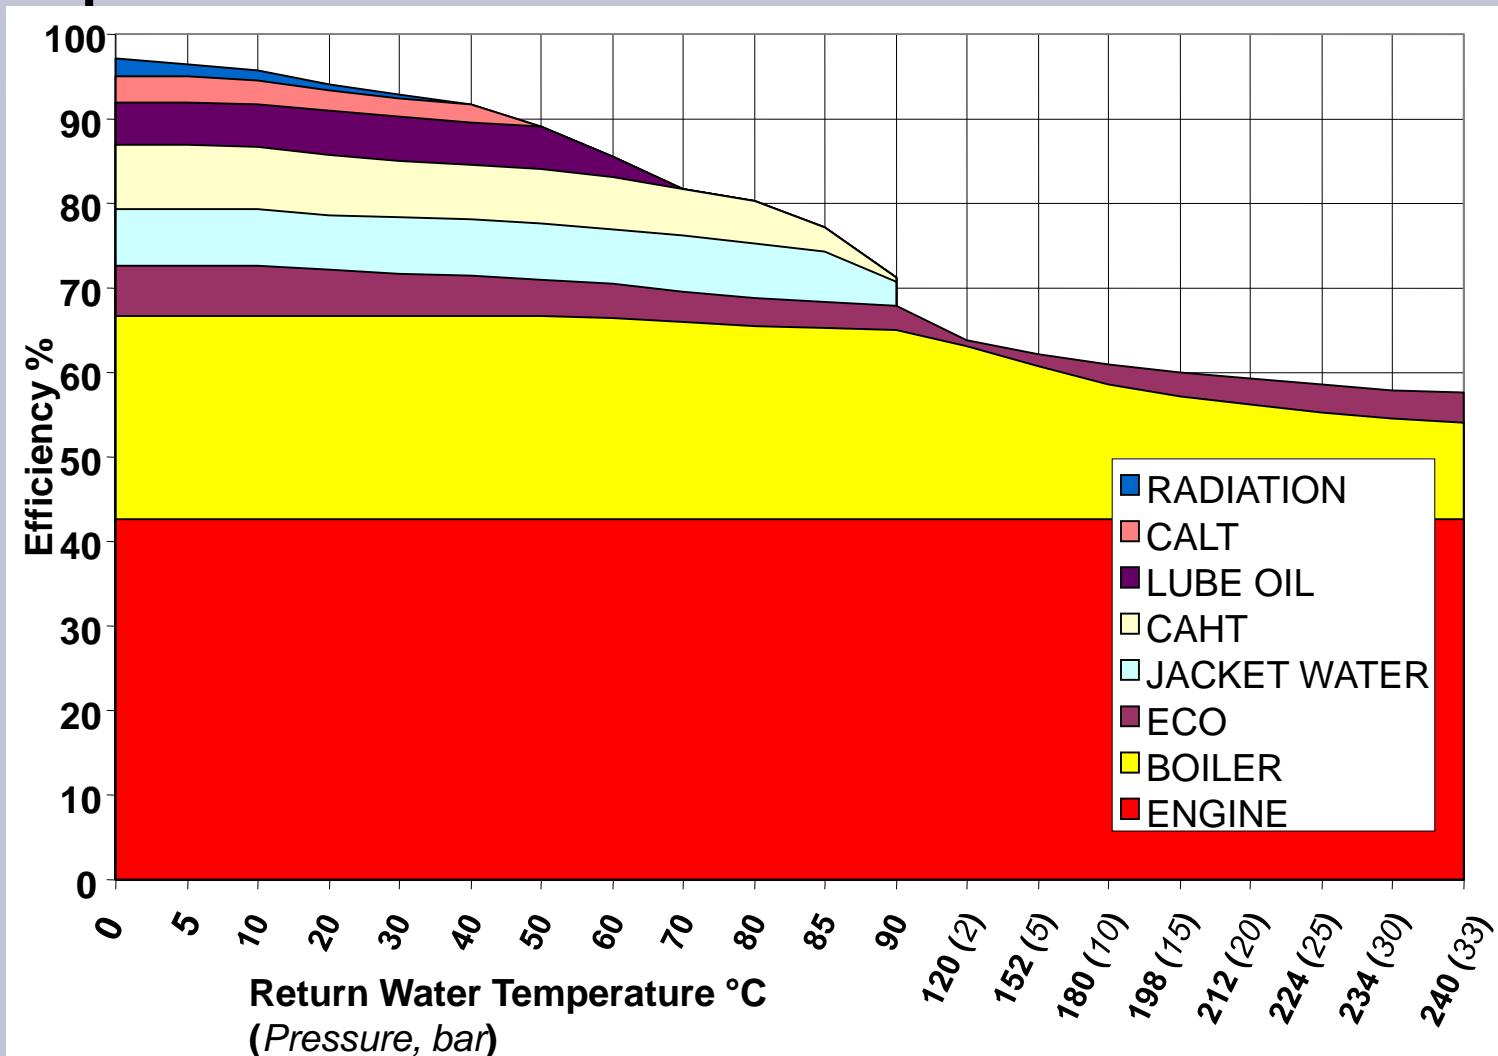

100 MW CHP Plant

6 x Wärtsilä 50 SG

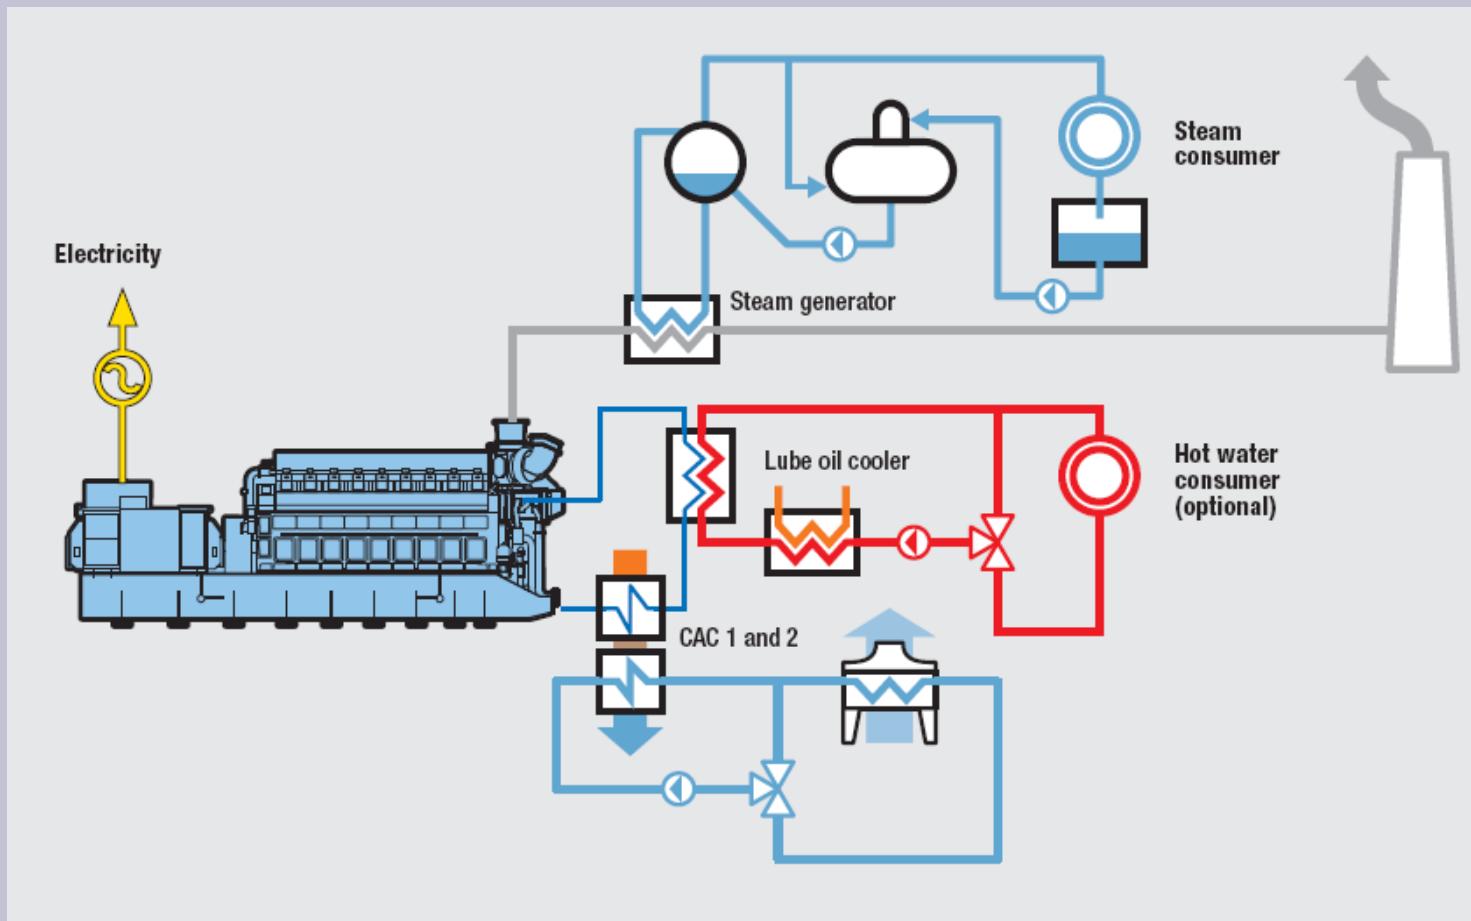

Energy balance (Wärtsilä)

Steam and hot water

Steam and hot water

- W20V34SG Engine

- Generator output: 8730 kWe

- Electrical efficiency: 44.3%

- Saturated steam, 8 bar: 4.8 t/h

- Electricity + steam efficiency: 60.5%

- Hot water 90/50°C: 3350 kW_{th}

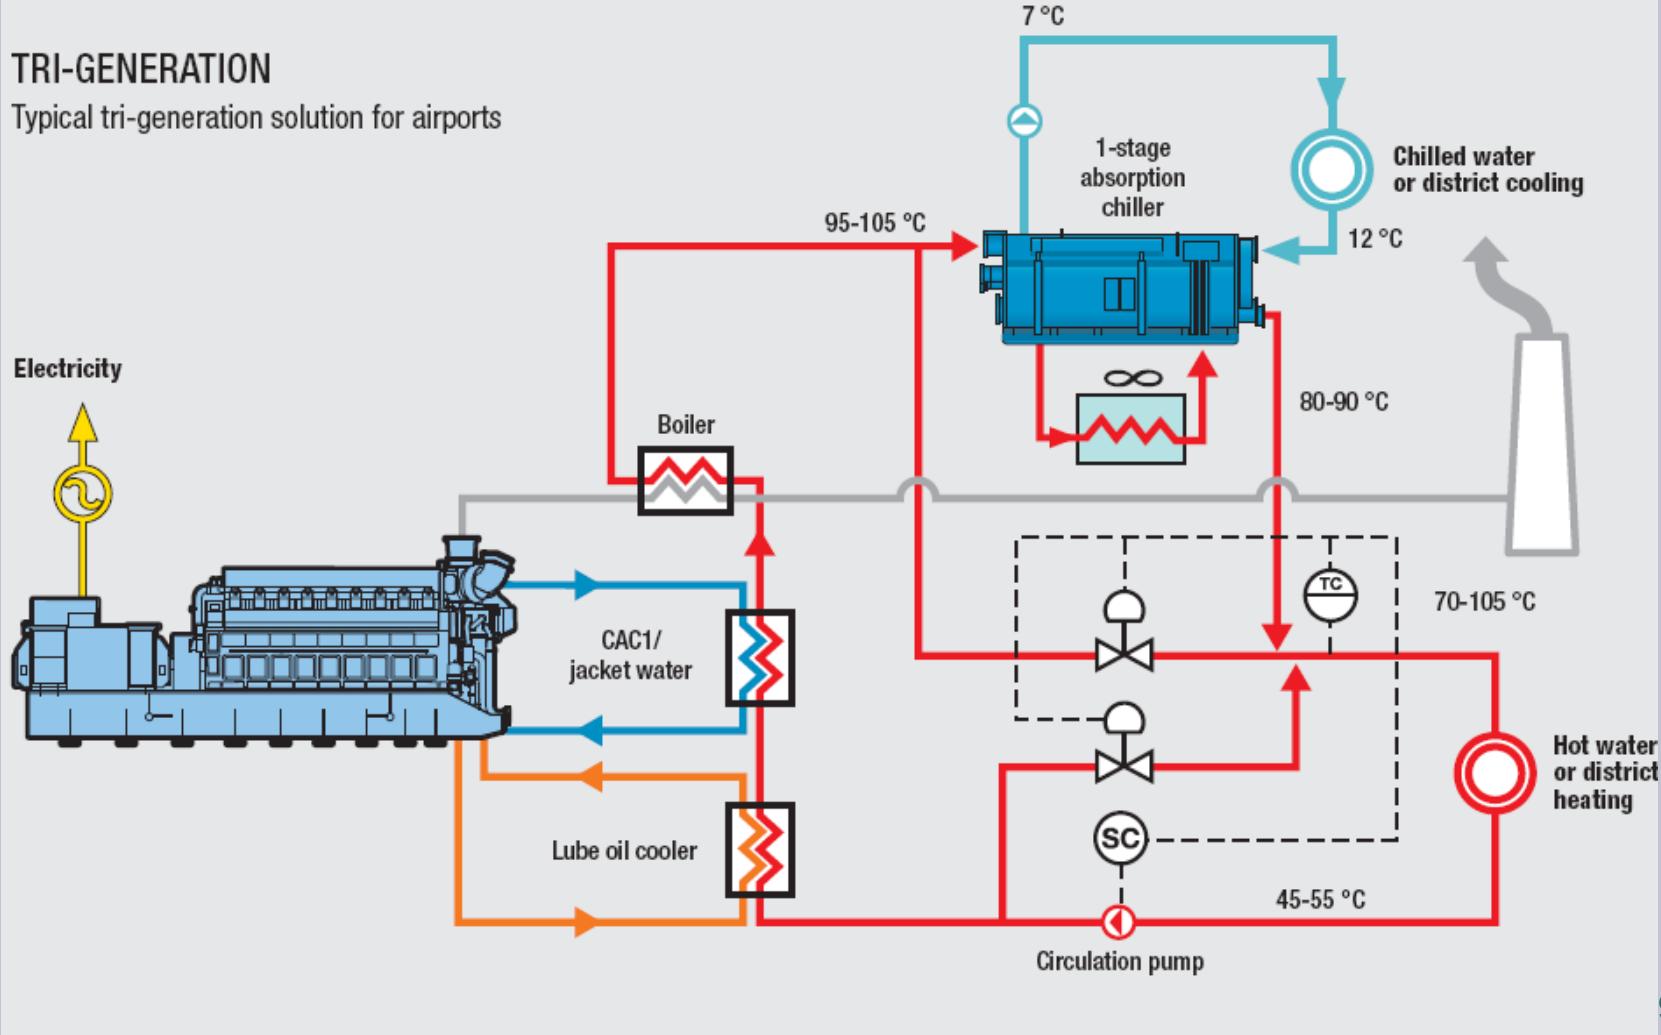

- Total efficiency: 77%

Hot and cold water and electricity

TRI-GENERATION

Typical tri-generation solution for airports

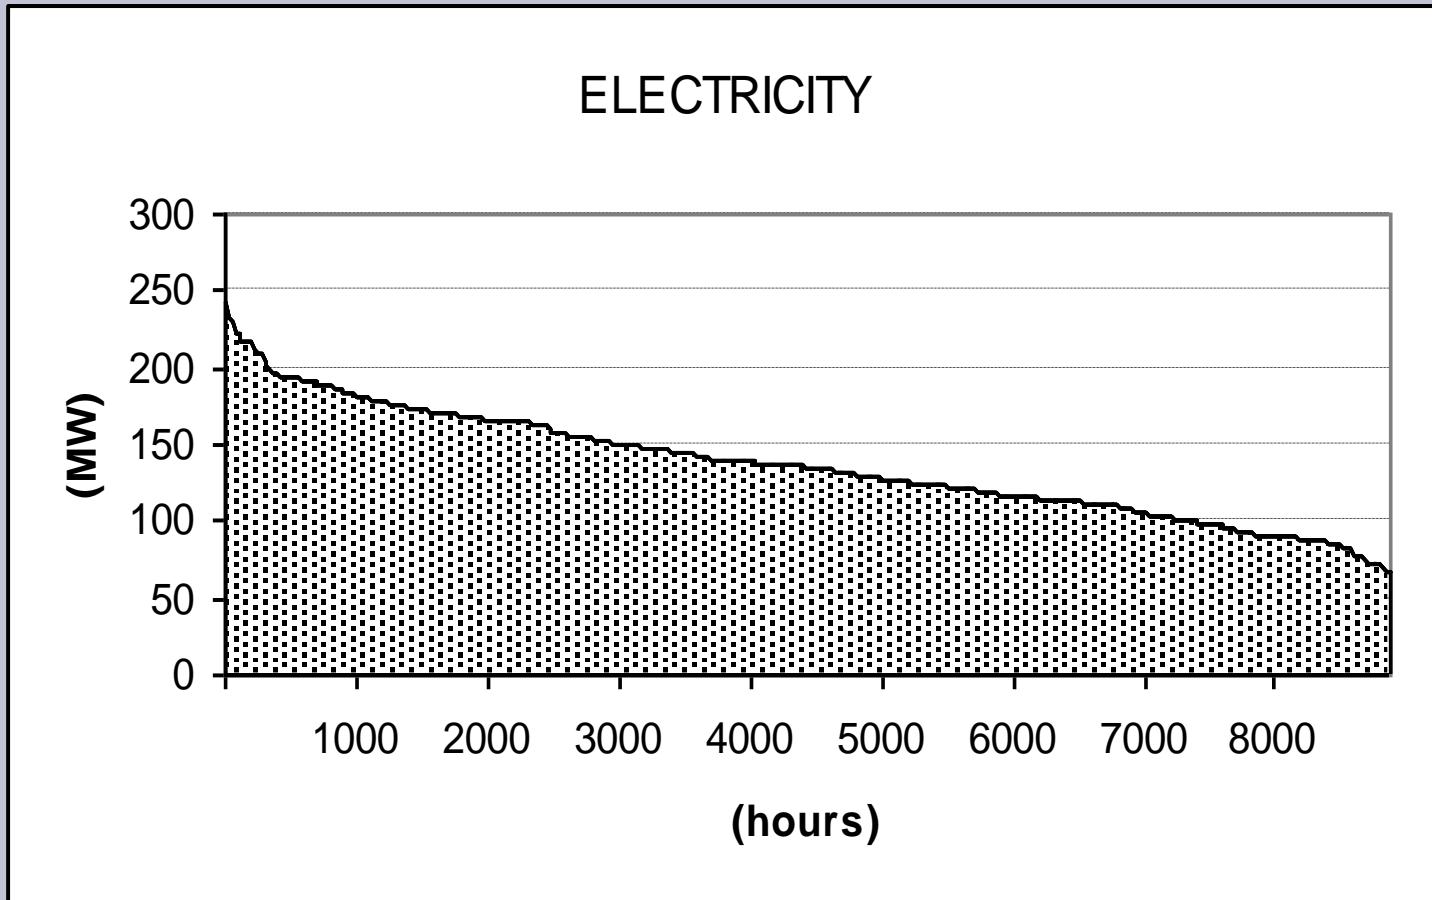

System conditions

- City in North-Europe
- 100 000 inhabitants
- Peak electricity load 250 MW
- Electricity consumption 1200 GWh/a
- Full power hours 4800 h/a

Electrical load duration curve

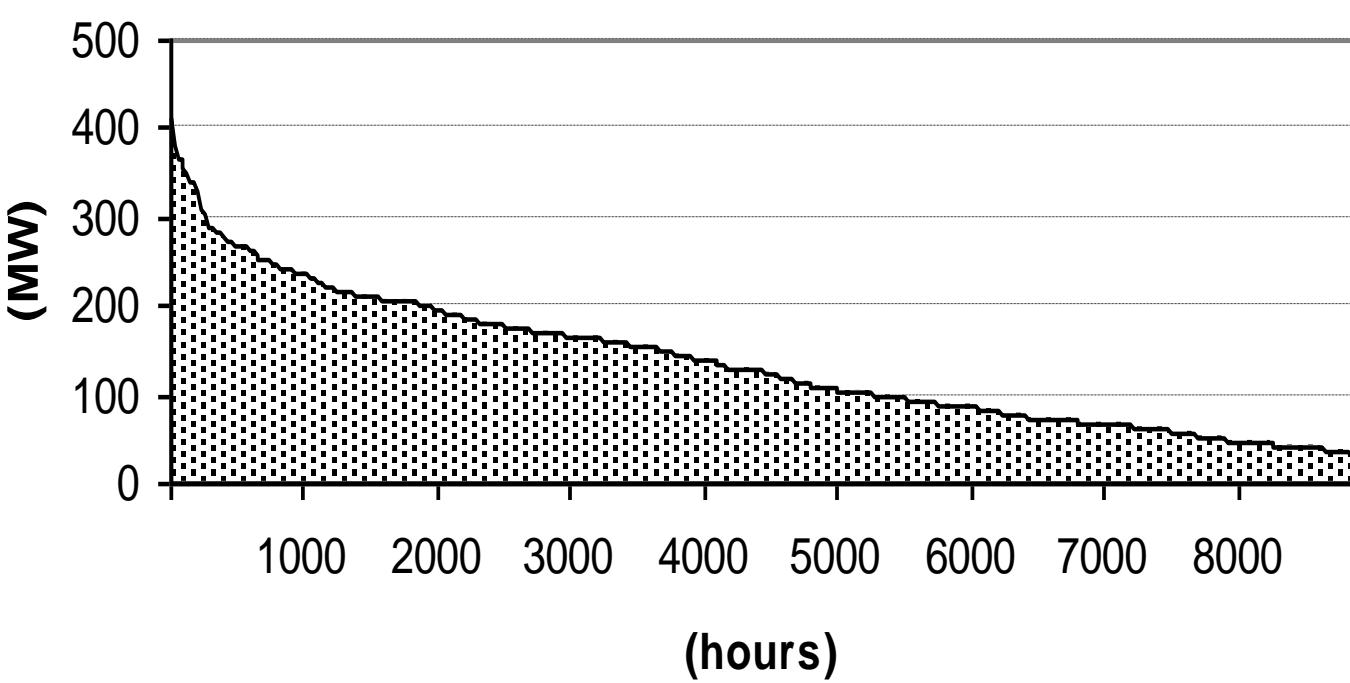

Heat load in district heating network

- Peak heat load 400 MW
- Heat consumption 1200 GWh/a
- Full power hours 3000 h/a
- Number of people living in district heated houses 80 000 (80 %)

Heat load duration curve

Power plant alternatives gas fired CHP plants

| | | GE* | DFCC** |
|-----------------------|----|------|--------|
| Electricity | MW | 32 | 67 |
| Heat | MW | 32 | 61 |
| P/Q | | 1.0 | 1.1 |
| Electrical efficiency | | 43 % | 45 % |
| Total efficiency | | 86 % | 86 % |

* Gas engine plant (4 x 8 MW)

** Dual-fuel combined cycle plant with 4 x 16 MW dual-fuel engines and 3 MW steam turbine or alternatively with 1 x 50 MW gas turbine and a 17 MW steam turbine

Power plant alternatives

Other plants

| | | Coal/bio* | HW boiler** |
|-----------------------|----|-----------|-------------|
| ----- | | | |
| Electricity | MW | 60 | - |
| Heat | MW | 120 | 30 |
| P/Q | | 0.5 | - |
| Electrical efficiency | | 28 % | - |
| Total efficiency | | 85 % | 85 % |

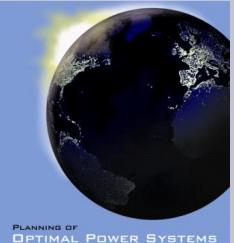

* Steam plant with back-pressure steam turbine using coal or woodchips

** Hot water boiler without electricity generation

What is the optimal size of a gas engine CHP plant?

- Specific investment costs become lower with larger size
- Full power hours in chp operation will become lower with larger size
- Optimal size is the one, which gives the best profitability of investment

Assumptions

- ○ Power plants will operate in full CHP mode and generate always heat and power at the same time*
- Ancillary services and reserve power needs are not taken into account**
- All the investments will be made at the same time***

* The CHP plant can also be designed to generate only electricity

** If the plant can start up in ten minutes, it can generate also non-spinning and regulation reserves and increase profits

*** Stepwise investments according to the growth of consumption are many times more profitable

Levelised energy prices*

Electricity

- internal sales 70 €/MWh
- external sales 60 €/MWh

Heat

40 €/MWh

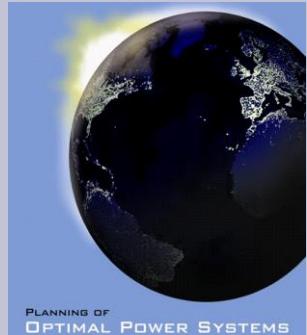

Natural gas

26.5 €/MWh

CO₂-allowance

15 €/t

- Levelised prices have been defined in presentation "Planning of national power systems"

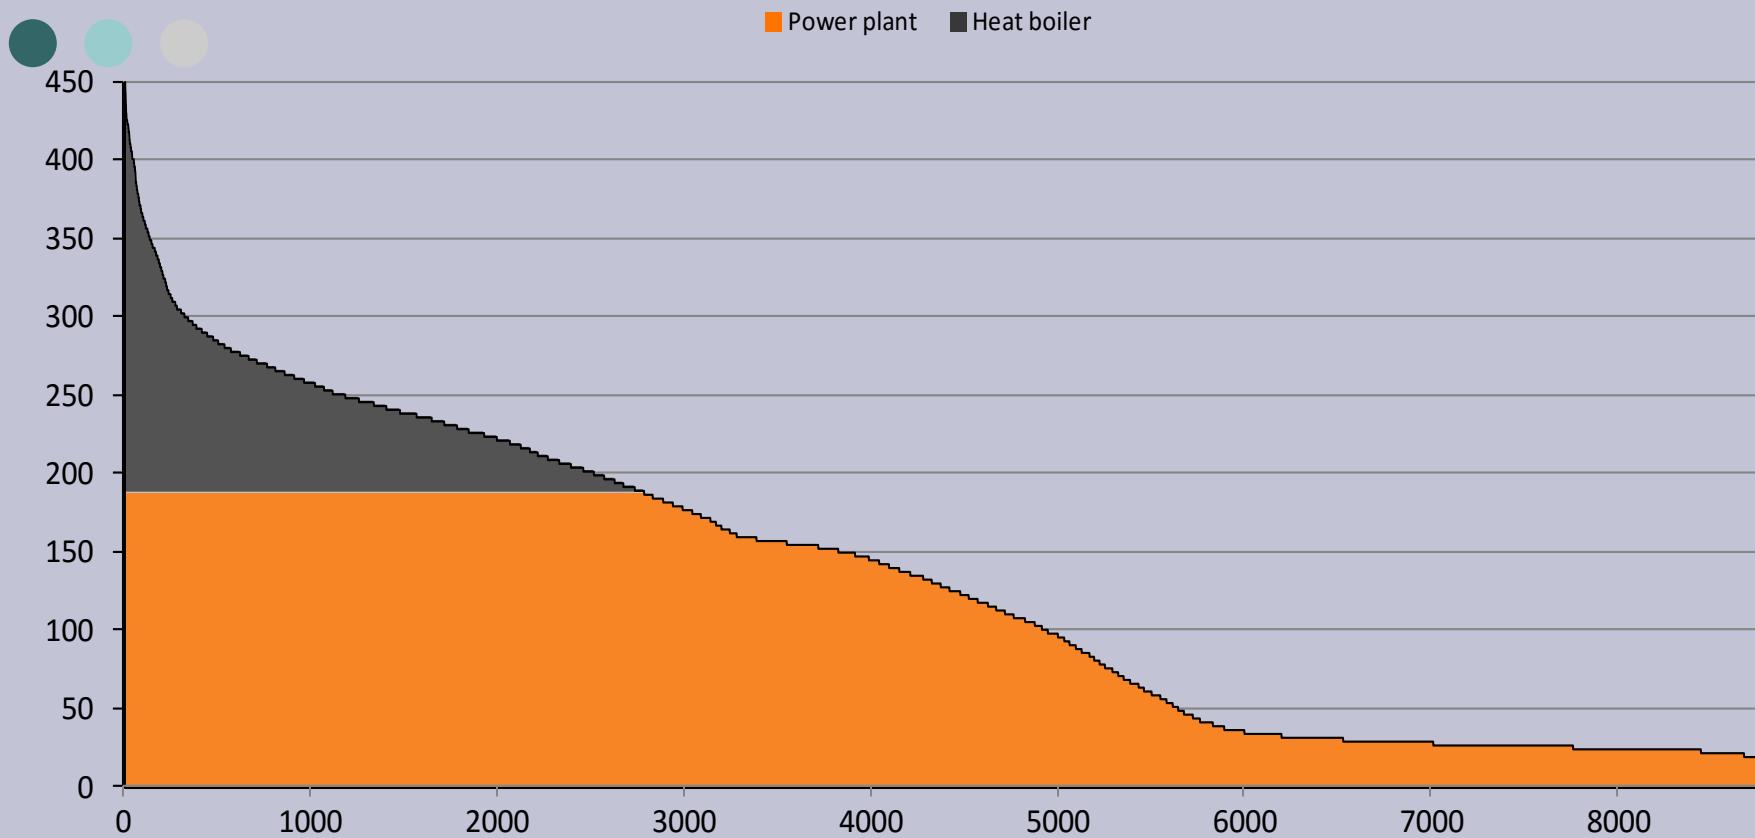

Optimal size of a gas engine CHP plant

Heat balance

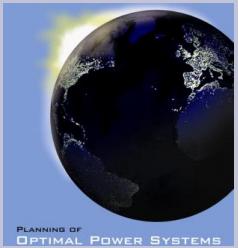

Annual Heat Supply

Electricity balance gas engine CHP plant

| Output MWe/MWt | Generation GWh | Purchases GWh | Ext. sales GWh |
|-------------------|-------------------|------------------|-------------------|
| <hr/> | | | |
| 0/0 | 0 | 1200 | 0 |
| 96/96 | 732 | 468 | 0 |
| 128/128 | 875 | 328 | 4 |
| 160/160 | 1005 | 219 | 24 |

| 224/224 | 1140 | 166 | 105 |
| 256/256 | 1168 | 166 | 133 |

Heat balance, gas engine CHP plant

| Output MWe/MWt | CHP plant GWh | HW boiler GWh | CHP share |
|-------------------|------------------|------------------|--------------|
| 0/0 | 0 | 1200 | 0 % |
| 96/96 | 732 | 468 | 61% |
| 128/128 | 875 | 325 | 73 % |
| 160/160 | 1005 | 195 | 84 % |
| 192/192 | 1088 | 112 | 91 % |
| 224/224 | 1139 | 61 | 95 % |
| 256/256 | 1168 | 32 | 97 % |

Investment cost estimates gas engine CHP plant

$$I(P) = I(P_0) \times (P/P_0)^y \times K_i$$

where

$I(P)$ = investment costs at output P

$I(P_0)$ = investment costs at output P_0 (22.5 M€)

P_0 = base output of gas engine plant (32 MW)

y = exponent (0.9)

K_i = coefficient for infrastructures (1.1)

Investment cost estimates gas engine CHP plant

| CHP plant MWe/MWt | CHP plant M€ | HW boiler M€ | Total M€ |
|----------------------|-----------------|-----------------|-------------|
| <hr/> | | | |
| 0/0 | - | 33.2 | 33.2 |
| 96/96 | 69.5 | 26.5 | 96.0 |
| 128/128 | 90.1 | 24.1 | 114.2 |
| 160/160 | 110.1 | 21.8 | 132.0 |
| 192/192 | 129.8 | 19.5 | 149.3 |
| 224/224 | 149.5 | 17.1 | 166.2 |
| 256/256 | 168.1 | 14.7 | 182.8 |

Profitability of gas engine CHP plant investment

| Output MWe/MWt | Investment M€ | Profit M€ | Inv./ profit |

| 192/192 | 17 | 3.1 | 5.5 |
| 224/224 | 17 | 2.6 | 6.6 |
| 256/256 | 17 | 1.6 | 10.5 |

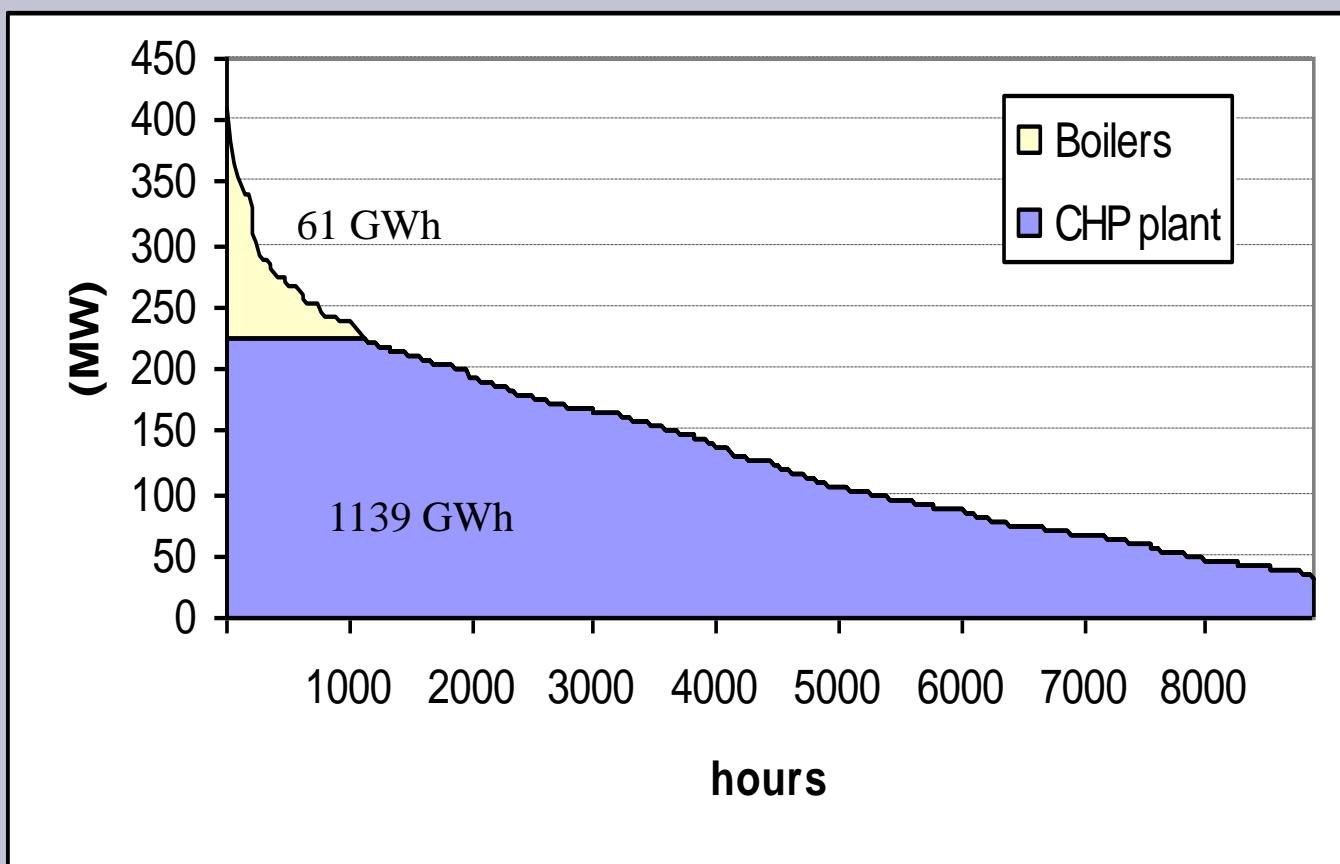

Optimal electricity balance of a gas engine chp system

CHP share = 95 % of electricity

Optimal heat balance of a gas engine CHP system

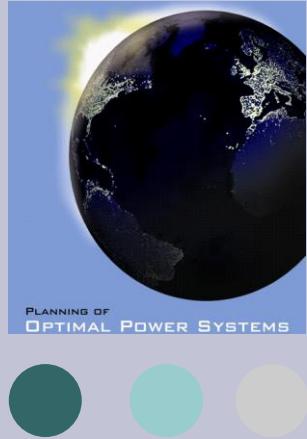

CHP share = 95 % of heat

Design parameters of the optimal gas engine plant

- Gas Engines 28 x 8 MW
- Electrical output 224 MWe
- Heat output 224 MWt
- Electricity gener. 1139 GWh
- Heat generation 1139 GWh
- Full power hours 5085 h/a

Optimal size of a coal or woodchip fired CHP plant

Heat balance coal or woodchip fired CHP plant

| CHP plant MWe/MWt | CHP plant GWh | HW boiler GWh | CHP share |
|----------------------|------------------|------------------|--------------|
| ----- | | | |
| 60/120 | 837 | 363 | 70 % |
| 90/180 | 995 | 205 | 83 % |
| 120/240 | 1006 | 194 | 84 % |
| 150/300 | 952* | 248 | 79 % |

* Generation becomes lower because of minimum output of the plant is 30 % of the nominal output

Electricity balance coal or woodchip fired CHP plant

| CHP plant MWe/MWt | Generation GWh | Purchase GWh | Ext. sales GWh |
|----------------------|-------------------|-----------------|-------------------|
| <hr/> | | | |
| 60/120 | 419 | 781 | 0 |
| 90/180 | 498 | 702 | 0 |
| 120/240 | 503 | 697 | 0 |
| 150/300 | 476* | 724 | 0 |

* Generation becomes lower because of minimum output of the plant is 30 % of the nominal output

Investment costs coal or woodchip fired CHP plant

Investment (P) = $(P/32)^{0.9} \times 32$ M€

| CHP plant MWe/MWt | CHP plant M€ | HW boiler M€ | Total M€ |
|----------------------|-----------------|-----------------|-------------|
| <hr/> | | | |
| 60/120 | 57.5 | 24.7 | 82.2 |
| 90/180 | 82.8 | 20.4 | 103 |
| 120/240 | 107 | 15.9 | 123 |
| 150/300 | 131 | 11.3 | 142 |

Profitability of coal fired CHP plant

| CHP plant MWe/MWt | Investment M€ | Profit M€ | Inv./ profit |
|----------------------|------------------|--------------|-----------------|
| ----- | | | |
| 60/120 | 82.2 | 41.5 | 2.0 |
| 90/180 | 103 | 48.6 | 2.1 |
| 120/240 | 123 | 50.7 | 2.4 |
| 150/300 | 143 | 50.6 | 2.8 |

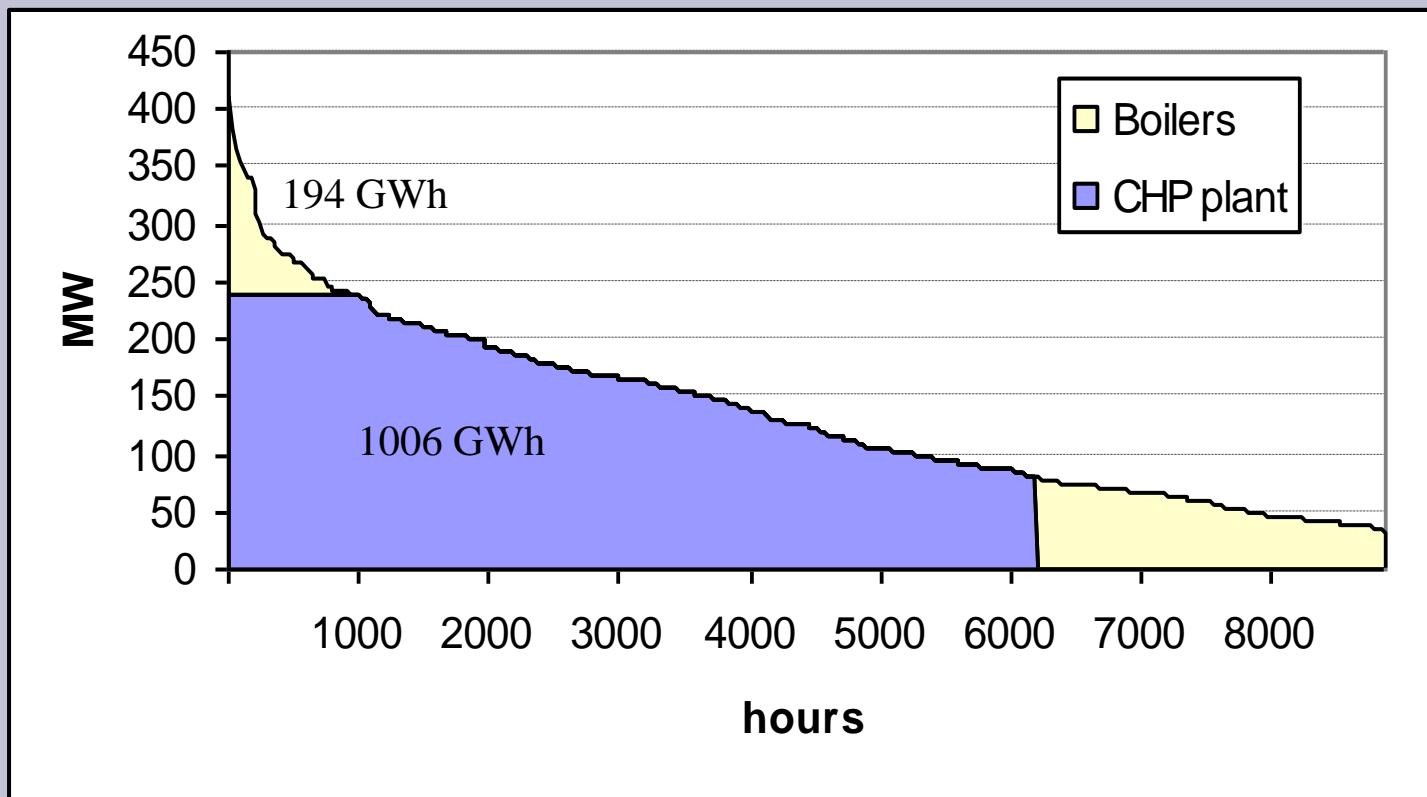

Marginal profitability coal fired CHP plant

| Output CHP plant MWe/MWt | Marginal Investment M€ | Marginal Profit M€ | Marginal inv./ mar. profit |
|--------------------------------|------------------------------|--------------------------|----------------------------------|
| 60/120 | 82.2 | 41.5 | 2.0 |
| 90/180 | 21 | 7.1 | 3.0 |
| 120/240 | 20 | 2.1 | 9.5 |
| 150/300 | 19 | -0.1 | neg |

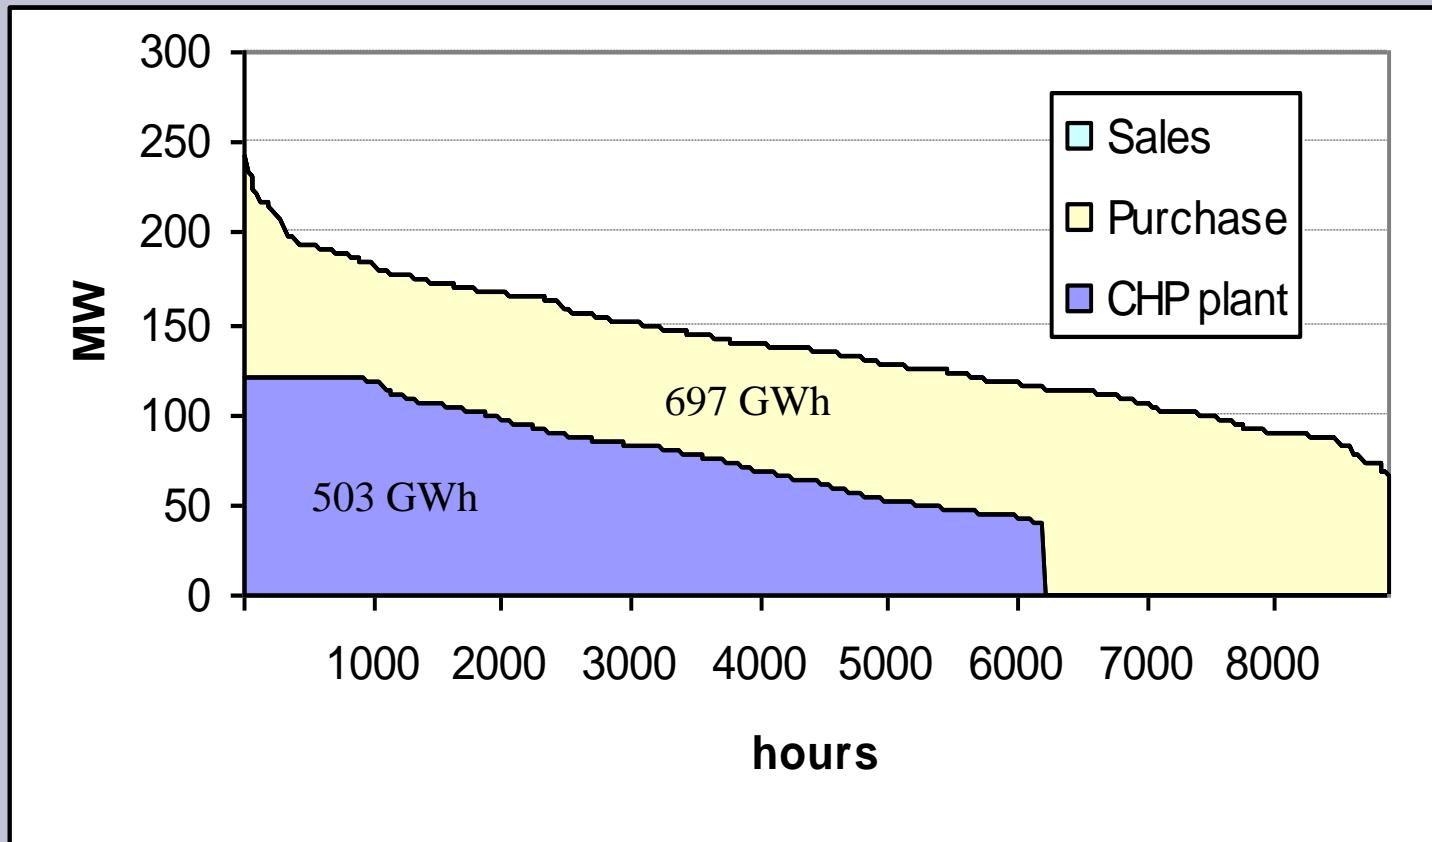

Optimal heat balance of a coal fired CHP plant

CHP share = 84 % of heat

Optimal electricity balance of coal or wood fired CHP plant

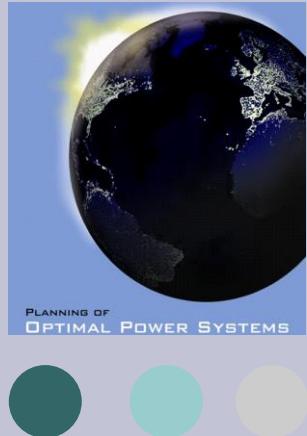

SHP share = 42 % of electricity

Design parameters of the optimal coal or woodchip fired CHP plant

- Steam turbine 1 x 120 MW
- Electrical output 120 MWe
- Heat output 240 MWt
- Electricity gener. 696 GWh
- Heat generation 1006 GWh
- Full power hours 4190 h/a

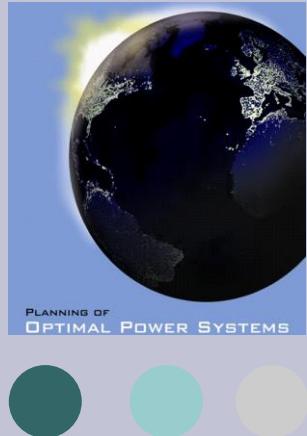

Comparison of systems

Comparison of systems

| System | Electrical output (MW) | (kW/capita) | CHP- share |
|-------------------|---------------------------|-------------|---------------|
| <hr/> | | | |
| GE-224/224 | 224 | 2.2 | 95 % |
| Coal/Wood-120/240 | 120 | 1.2* | 84 % |

- * With coal/wood fired plant the potential capacity of CHP system is only 55 % of the capacity of a gas engine (GE) or dual-fuel combined cycle systems

Evaluating the potential CHP capacity in Finland

Potential CHP capacity of cities (kWe/capita)

| Area | Natural gas available | |
|--------------|-----------------------|-----|
| | Yes | No |
| <hr/> | | |
| Large cities | 2.3 | 1.2 |
| Small cities | 2.2 | 1.0 |

Population living in district heated houses in Finland (thousands)

| Area | Natural gas available | | Total |
|--------------|-----------------------|-----|-------|
| | Yes | No | |
| <hr/> | | | |
| Large cities | 1364 | 358 | 1722 |
| Other areas | 450 | 283 | 733 |
| <hr/> | | | |
| Total | 1814 | 641 | 2455* |

* 47 % of people live in district heated houses

Potential CHP capacity in Finland (MWe)

| Area | Natural gas available | | |
|--------------|-----------------------|-----|-------|
| | Yes | No | Total |
| <hr/> | | | |
| Large cities | 3270 | 430 | 3700 |
| Other areas | 855 | 255 | 1110 |
| <hr/> | | | |
| Total | 4125 | 685 | 4810 |

Potential new municipal CHP capacity in Finland

| | |
|-----------------|----------|
| Total potential | 4810 MW* |
| Capacity today | -4420 MW |

Potential new capacity **490 MW**

*Total potential = 0.9 kWe/capita
(Finnish total population is 5.4 Million)

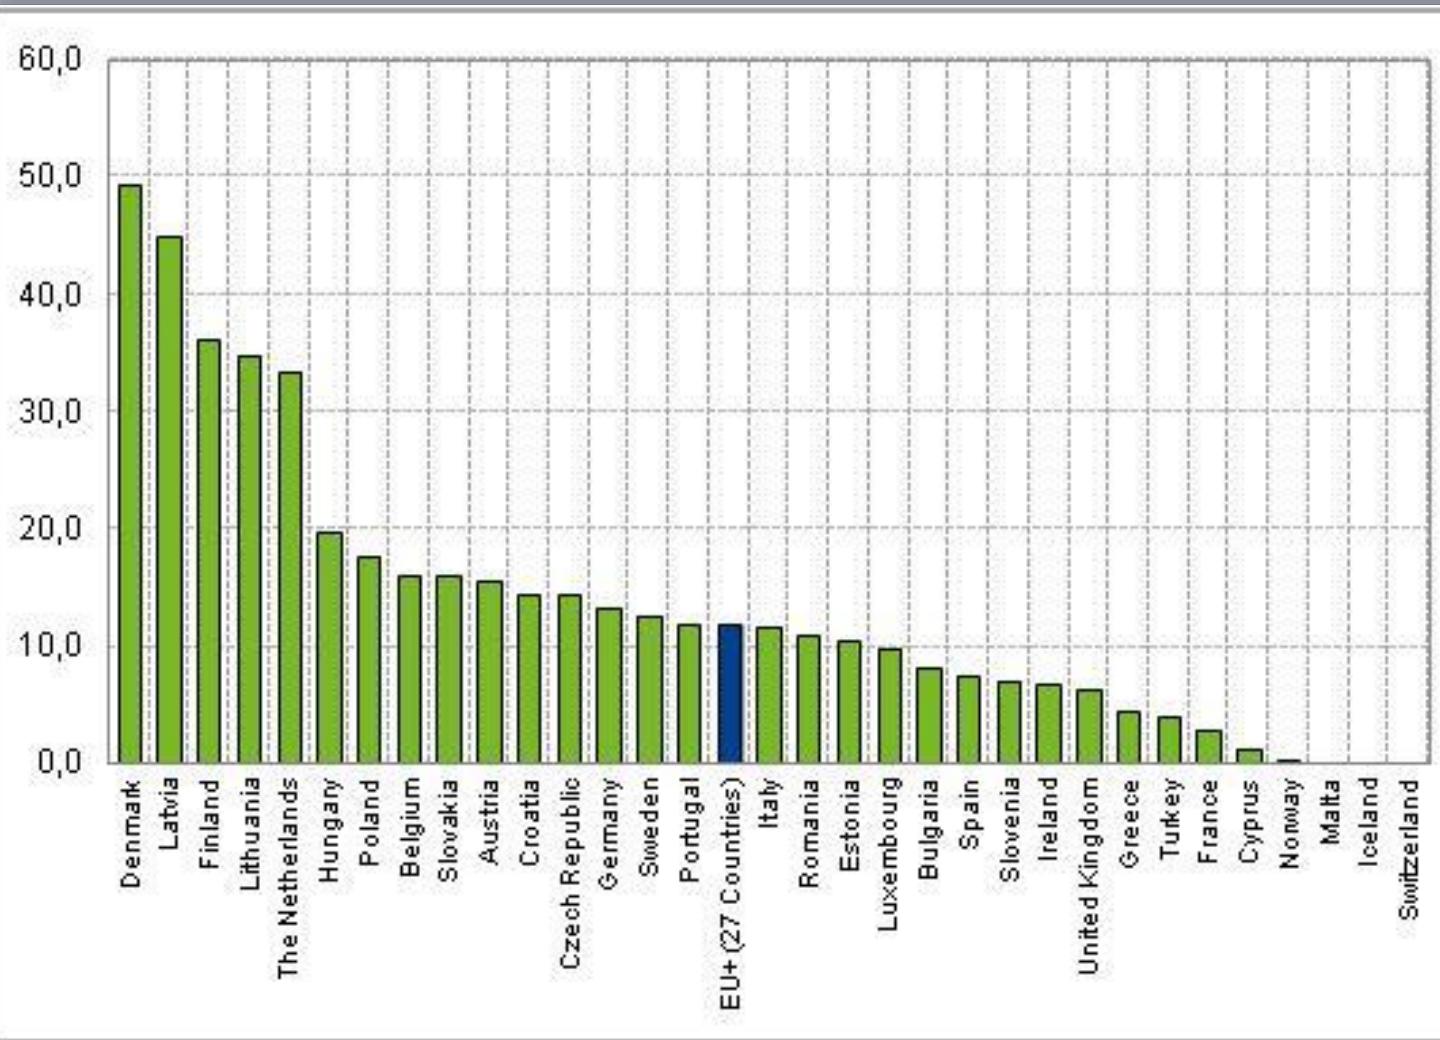

CHP capacity of the eight largest cities in Finland

| City | CHP capacity (MWe) | Population in DH (number) | Capacity per capita (kW/capita) |
|-----------|-----------------------|---------------------------------|---------------------------------------|
| Helsinki | 1017 | 595 000 | 1.71 |
| Espoo | 365 | 252 000 | 1.45 |
| Tampere | 336 | 203 000 | 1.65 |
| Turku | 261 | 195 000 | 1.34 |
| Vantaa | 250 | 169 000 | 1.48 |
| Oulu | 188 | 141 000 | 1.33 |
| Jyväskylä | 328 | 92 000 | 3.57 |
| Lahti | 249 | 90 000 | 2.77 |
| Total | 2994 | 1737 000 | 1.72 |

CHP share of electricity in EU 2010

Summary

The potential CHP capacity is about 2 kWe/capita in cities with gas network and 1 kWe/capita in other cities in the Nordic countries

The cities can planned to be independent of outside electricity by building gas fired CHP plants
